Practical 02: test driven development

Introduction:

This practical will introduce you to test driven development with ruby on rails. It will also give you a little extra work to do on top of that list in the notes

Problems:

01) Implement everything in the lecture notes

02) Add in tests, a route, and an embedded ruby file for another page called timetable. this work should be done on a seperate git branch. This file should list your classes, what times they are on, what room they are in, and who is teaching.

03) modify your timetable page to store everything in a html table

04) merge your current branch back into the mainline.
